Sprint 4 Report

Sprint 4 Demo: https://youtu.be/rXpR0tCRo-g

What's New (User Facing)

- UI Updates

Work Summary (Developer Facing)

During this sprint, our team continued to work around the fact that we still haven't received access to the new codebase following the CAIRE team's summer migration. To keep making progress, we set up a local development environment running the old code against a local database and used it to implement frontend changes. Because we can't yet confirm what infrastructure changed in the new code, we limited development to frontend work that is less likely to be affected by the migration. We also researched frontend, backend, and production migration considerations based on the old codebase, so we'll be ready to apply our work and move quickly once access is granted.

Unfinished Work

Two planned items for this sprint remain unfinished because we still don't have access to the new codebase. First, we intended to test all of the functions we developed last semester to confirm they still work after the migration, but we can't do that meaningfully without the updated code. Second, we planned to optimize the database. Since we don't know how the database structure or infrastructure may have changed in the new code, optimizing the old version would risk wasting effort, so we postponed this work. Both items will carry over to the next sprint, and we plan to prioritize them as soon as access is granted.

Completed Issues/User Stories

User Story: Improve Admin Dashboard with Data Visualization

As an admin, I want to view graphs and visualizations of platform activity, so that I can easily track content statistics and better understand how the platform is being used.

Acceptance Criteria:

- Display graphs showing the number of posts by category or type.
- Show key statistics, such as total posts, questions, and other content.
- Make data easy to understand through clear, organized visualizations.
- Ensure dashboard statistics reflect current database information.

Incomplete Issues/User Stories

Not applicable.

Code Files for Review (Located in the adapt-ai azure repository)

We cannot show code here as the client's repository is private.

Retrospective Summary

Here's what went well:

- UI changes and demos through the old code.
- Frontend, backend, and production research.
- Communication with the client.

Here's what we'd like to improve:

- Need to get access to the code base.

Here are changes we plan to implement in the next sprint:

- Test and review community functions.
- Implement UI into new code and test.
- Optimize database queries.
- Continue to iteratively improve community analysis dashboard.
- Full system testing.
